

# Releasenotes Visual 4.9

## Changelog

Version 4.9 introduces some new management functions. The change log is one of them. The change makes it possible to track on item level what has been changed and by whom it has been changed. Each change is logged by date, time, function and user. This makes it possible to look back in time and compare an item with its current value. Deleted data will be logged and transferred to the trash can.

## Searchfunction

The search function is now shown in the topmenu bar. It is possible to use the search function to get an overview of all changes from a set reference date. This feature will only work if the changelog function has been activated.

## Authorisation on Areas of interest level

A second improvement on management level is the possibility to give authorisation at area of interest level. Previously you could only set authorisation groups to models. Version 4.9 makes it possible to create an authorisation group per area of interest. This gives you the advantage of being able to add users to a particular area of interest. users can be added to areas of interest based on their rights.
